The Evolution and Benefits of Technology

Technology is becoming more prevalent and necessary in today's society. We can see cell phones attached to the palm of most teenagers' hand. Also, a computer can most likely be seen in cafés, libraries, hotels and public places across America. What is the benefit if technology? Is it more harmful than beneficial? I believe technology provides a feeling of safety as in having the ability to use cell phones after a car accident or during a kidnapping. I also feel computers provide new and innovative ways in presenting information.

I use technology in my ever day life. I use computers, cordless phones as well as mobile phones. Each of these devices has their own way of assisting me. My cell phone for example provides an alarm clock to help me wake up in the mornings. It also allows me a form of communication other than email or face-to-face communication. My computer lets me write essays and keep in contact with colleges and family across the country. Not only is it easy to use these devices, but it is quick. There is no longer a need to send a letter in the mail. If it is imperative for me to get information sent to a college or university, I have faith in an email I can send to arrive to its destination quickly.

I believe technology will improve our lives in the future. Technology is prevalent in forms different than forms of communication. The new technology today helps hospitals perform more accurately. Better computers in the education field equip students with accurate information just lingering at their fingertips. I believe we will soon see technology in cars of the future. Instead of running off gas, they might have the possibility of running off our unlimited solar power. Many benefits can come of a new technological discovery in the auto industry such as a healthier environment.

I am thankful for the scientists and engineers who have dedicated so much time, effort, and money into the study of technology. It is evolving rapidly, but I believe for the better. We are entering a new age as Americans: the age of technology. It is beneficial now because it allows for easier ways of communication. It also provides a feeling of safety. In the future, technology may have the power to improve the condition of the environment.
